88
89     (* Question 2.1
90         j is used with an addition operation, hence j is inferred to be an
91         itneger.
92         xs can be inferred to be some sort of list, by the pattern matching.
93         (Can easily be seen by the [] -> [] case)

```

```

92      output is also inferred to be some sort of list by the pattern matching. ↗
          (Can easily be seen by the [] -> [] case)
93      f is a function which is used with j and an element of xs.
94      there is no information for what kind of type the elements within xs ↗
          has to be, also there is no information about what type f has as ↗
          output,
95      hence the generic types 'a for elements within xs and 'b for elements ↗
          after f has been applied.

96
97      Therefor:
98      j : int
99      f : (int -> 'a -> 'b)
100     xs : 'a list
101     output : 'b list
102
103     h : (int -> 'a -> 'b) -> 'a list -> int -> 'b list
104
105     *)
106
107     (* Question 2.2
108
109         given
110         f : (fun i x -> (i,x))
111         xs : ["a";"b";"c"]
112         (and 0 as j in h, as declared in mapi)
113
114         => mapi (fun i x -> (i,x)) ["a";"b";"c"]    (=>) h (fun i x -> (i,x)) ↗
            ["a";"b";"c"] 0
115         => (0,"a")::h (fun i x -> (i,x)) ["b";"c"] 1
116         => (0,"a")::(1,"b")::h (fun i x -> (i,x)) ["c"] 2
117         => (0,"a")::(1,"b")::(2,"c")::h (fun i x -> (i,x)) [] 3
118         => (0,"a")::(1,"b")::(2,"c")::[]    (Concatinating elements from here.)
119         => [(0,"a");(1,"b");(2,"c")]
120
121     *)
122
123     (* Question 2.3
124
125         (fun i x -> (i,x)) : 'a -> 'b -> ('a * 'b)
126         The expression is a function which takes 2 inputs respectively i and x, ↗
            putting them together in a tuple. Types for i and x can be whatever, ↗
            there is no operations which forces behavior or type restrictions.

127
128         ["a";"b";"c"] : string list
129         Double qoutes is in many programming languages including F# the way to ↗
            indicate literal string values.

130
131         'a in h is forced to be an integer because of the previously mentioned ↗
            addition operation, as a result forces 'a or rather i in f to be an ↗

```

```

integer aswell.
132     Using a list of strings will give string in 'b' or rather x in f.
        Therefor the result of f will give a tuple of integer and string, 'b
        in h.
133
134     *)

167     | C(_,s) -> 1 + List.max (List.map (fun x -> depth x) s)
168
169     (* Question 3.3
170
171     "Name" is a string type. (Declared as string type)
172
173     "Part" is the name of the type being declared, which for F# is given
        after the keyword "type".
174

```

```

D:\development\development_lib\Project\F#\DanielFHaugeS201186.fs 5
175     "S" is one of valid union cases of Part. Part is a discriminated union ↗
        type, a type which may contain a set of different kind of types, ie. ↗
        The full set of all possible values within each union case.
176     S consists of Name which is a string type, hence S is the union case ↗
        where Part is just a simple part.
177
178     "*" indicating a relation, said simply: making a record or tuple.
179
180     "list" is a keyword for indicating a list type. ex. string list.
181
182     "C" is the other valid union case of Part. The valid type for C is a ↗
        tuple consisting of Name in the first value and a list of Parts in ↗
        the second value.
183     Part is recursive in nature as the union case C contain the same type ↗
        in the form of a Part list.
184
185     *)
186
